 - Heterogeneous analysis tools (OpenSees, OpenSHA, PACT)
 - New tech needs to be brought in (data analytics, Bayesian inference, etc.)

Objectives

Risk framework for a highway network
(Miller & Baker, 2015)

Objectives

Develop a (semi-) automated interactive platform that can evaluate seismic vulnerability of complex transportation networks:

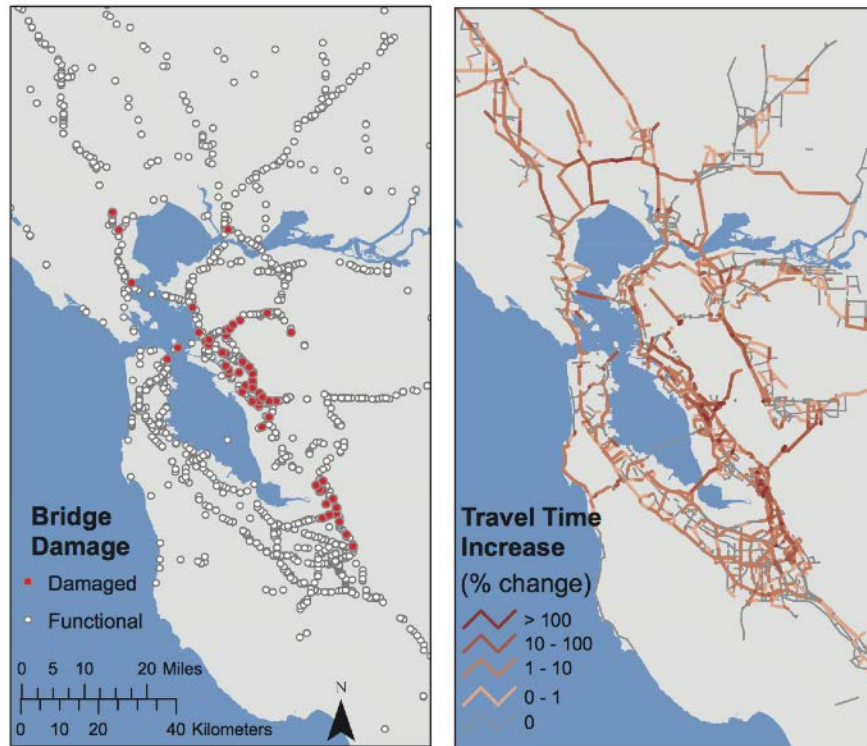

Risk framework for a highway network
(Miller & Baker, 2015)

Objectives

Develop a (semi-) automated interactive platform that can evaluate seismic vulnerability of complex transportation networks:

1. Generate structural models using data harvested from various sources

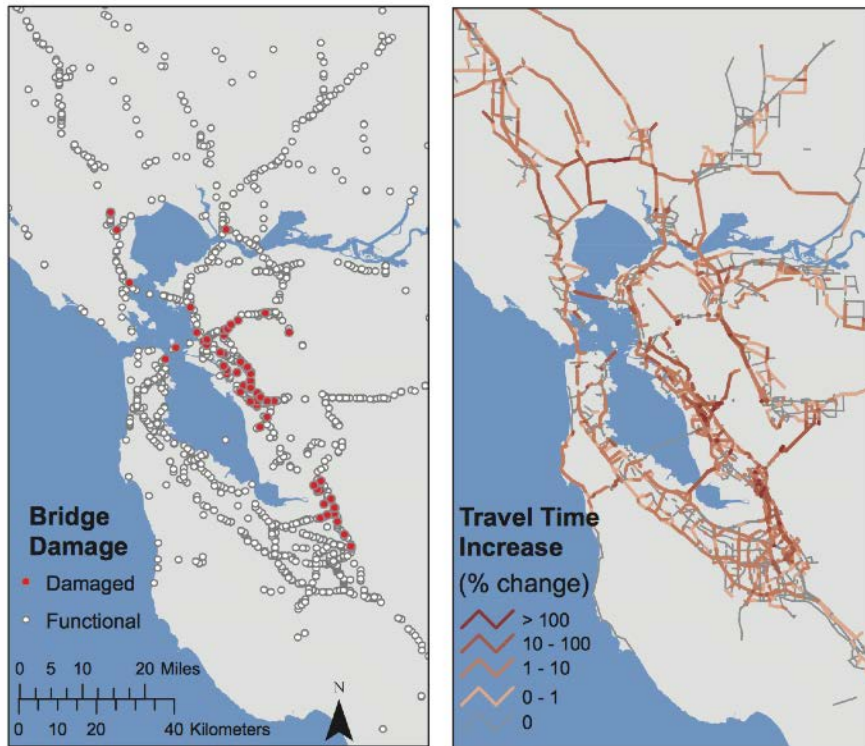

Risk framework for a highway network
(Miller & Baker, 2015)

Objectives

Develop a (semi-) automated interactive platform that can evaluate seismic vulnerability of complex transportation networks:

1. Generate structural models using data harvested from various sources
2. Carry out site- and structure-specific seismic analyses

Risk framework for a highway network
(Miller & Baker, 2015)

Objectives

Risk framework for a highway network
(Miller & Baker, 2015)

Develop a (semi-) automated interactive platform that can evaluate seismic vulnerability of complex transportation networks:

1. Generate structural models using data harvested from various sources
2. Carry out site- and structure-specific seismic analyses
3. Evaluate the consequent economic losses at the network-level

Objectives

Risk framework for a highway network
(Miller & Baker, 2015)

Existing predictive computational tools and IT capabilities allow *unprecedented granularity* for such seismic risk and loss assessment studies

Objectives

Risk framework for a highway network

Determination of Column Properties

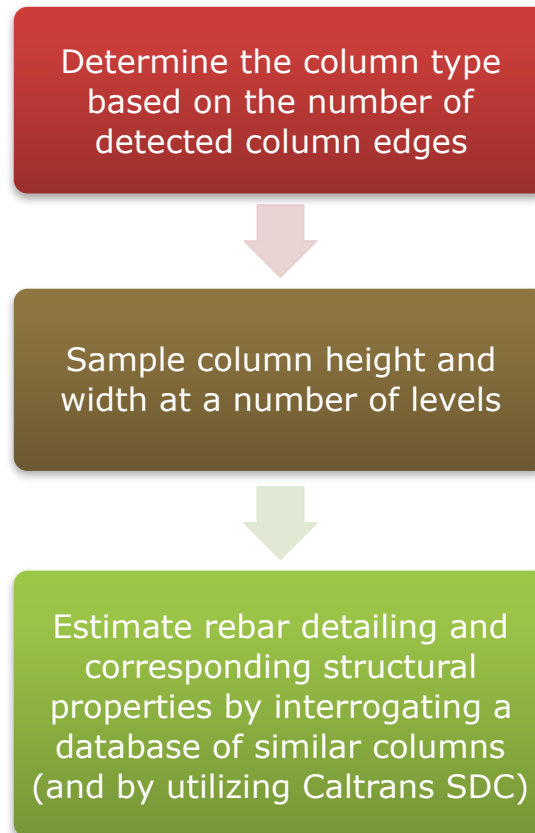

Image to Model

Determination of Column Properties

21.2.1.2 Column Reinforcement Requirements

(1) Longitudinal Reinforcement

Maximum Longitudinal Reinforcement Area, $A_{sr,max} = 0.04 \times A_g$ (SDC 3.7.1-1)

Minimum Longitudinal Reinforcement Area:

$$A_{sr,min} = 0.01(A_g) \quad \text{for columns} \quad (SDC 3.7.2-1)$$

$$A_{sr,min} = 0.005(A_g) \quad \text{for Pier walls} \quad (SDC 3.7.2-2)$$

where:

A_g = the gross cross sectional area (in.²)

Normally, choosing column $A_{sr} = 0.015(A_g)$ is a good starting point.

(2) Transverse Reinforcement

Either spirals or hoops can be used as transverse reinforcement in the column. However, hoops are preferred (see *MTD 20-9*) because of their discrete nature in the case of local failure.

Determine the column type based on the number of detected column edges

Sample column height and width at a number of levels

Estimate rebar detailing and corresponding structural properties by interrogating a database of similar columns (and by utilizing Caltrans SDC)

Validation study

Image processing to identify bent locations and developing the wireframe model

Validation study

Image processing to identify bent locations and developing the wireframe model

Identification of bent locations

*Using **UCLA** automated image-based structural model development program via *Image Analyzer Module*

Validation study

Image processing to identify bent locations and developing the wireframe model

Identification of bent locations

*Using **UCLA** automated image-based structural model development program via *Image Analyzer Module*

*Using **UCLA** automated image-based structural model development program via *Wireframe Model Builder Module*

Establishing of wireframe model

Validation study

Image processing to identify in-span hinge locations

Identification of in-span hinge locations

*Using **UCLA** automated image-based structural model development program via *Image Analyzer Module*

Validation study

Image processing to identify in-span hinge locations

Identification of in-span hinge locations

*Using **UCLA** automated image-based structural model development program via *Image Analyzer Module*

Validation study

Using of auxiliary data to determine superelevation profile*

Determination of curve superelevation at each sampling point

Using **UCLA automated image-based structural model development program via *Image Analyzer Module*

Identify centerline geometry in terms of constituent curves/spirals.

Get bridge speed limit data through Google Roads API.

Estimate curve superelevation at each sampling point.

Basic methodology to determine curve superelevation profile

Validation study

Determination of bridge column dimensions

Detection of column edges

*Using **UCLA** automated image-based structural
model development program via *Fuzzy Logic*
Edge Detection Module

Validation study

Determination of bridge column dimensions

Detection of column edges

*Using **UCLA** automated image-based structural model development program via *Fuzzy Logic Edge Detection Module*

*Using **UCLA** automated image-based structural model development program via *Pixel Counter Module*

Determination of column dimensions

Map Satellite

8244 Orion Ave, Van Nuys, CA 91406

CGS CSMP-24386
Van Nuys - 7-story Hotel

Station: Van Nuys - 7-story Hotel
Latitude: 34.2201
Longitude: -118.471
Elevation (m): 245
Num of Stories: 7
Basement: 0
Plan Shape: Rectangular
Base Dimensions: 151' x 63'
Typical Floor Dimensions: 151' x 63'
Design Date: 1965
Instrumentation: 1980, 16 accelerometers, on 5 levels in the building.
Information: <http://www.strongmotioncenter.org/cgi-bin/CESMD/station.html?staid=CE24386&network=CGS>
